The Royal Meteorological Society website provides several datasets. Both temperature and precipitation data stretching back centuries is available for use. The Central England Temperature (CET) series encompasses an area around Bristol, Lancashire, and London. The dataset begins in 1659 and is the longest instrumental record of monthly temperature records in the world. Along with this, the England & Wales Precipitation (EWP) series is the longest standing dataset of instrument measured precipitation in the world. This dataset stretches back to 1766.

The Global Observing Systems Information Center was created as a centralized website to find various information and datasets provided by other organizations. The information and datasets are provided by the Global Climate Observing System (GCOS), the Global Ocean Observing System (GOOS), the Global Terrestrial Observing System (GTOS), the Global Atmosphere Watch (GAW), as well as other regional observing systems. The information available encompasses datasets for many different studies and research relating to land-surface interface, oceans, sea level, sea ice, coastal observations, sun-earth interactions, biology, spectral studies, climate indicators, atmospheric parameters for surface and upper-air data, et cetera. Much of the dataset categories that have been listed provide data on numerous different areas of the world. This website acts as a one-stop spot to accessing the datasets necessary to enable all sorts of scientific research.
