Webpage <http://water.weather.gov/ahps/rfc/rfc.php>

The webpage that I am interested in and use on many occasions is the River Forecast Center web page. The River Forecast Center is part of NOAA and the National Weather Service. While this does not pertain to my research in a direct way, it is what I want to be a part of once I graduate. The 13 river forecast centers around the country are responsible for monitoring and forecasting the rivers in each ones domain. They issues warning about long term flooding and possible damn and levy breaches along their river system. Theses centers work with the National Climate Data Center as well as with the Weather service to determine crest levels and routing schemes to insure public safety. On the web page many different products can be found from current levels forecast levels and stages that the rivers will me or are presently at. Information about the damns along the rivers in the forecast area can also be found on the website. River forecast centers deal with snowfall as well as rainfall and assists the public in knowing in advance what river stages will be like. Their webpage's are for the most part easy to use and have many products for all types of industries and the general public.
